About this genus

**Rudbeckia** species are commonly known as Black-eyed Susans or Coneflowers. The most widely available native is Black-eyed Susan (**Rudbeckia hirta**), found throughout Florida in sandhills, flatwoods and disturbed areas, including the variety *Rudbeckia hirta var. floridana*, endemic to Central and South Florida.

Softhair Coneflower (**Rudbeckia mollis**) and Cutleaf Coneflower (**Rudbeckia laciniata**) can be used successfully throughout the Panhandle and in North and Central Florida.

**Description**

Black-eyed Susan, especially the variety found in Central and South Florida, appears to be perennial. However, varieties may be annual, biennial or perennial. Plants are generally 1 to 2 feet tall with most of the foliage on the bottom half. Leaves are very rough to the touch (which can help identify young plants). The 3- to 4-inch deep-yellow aster-like flowers have dark brown disk flowers in a central dome. *Rudbeckia* blooms spring through fall, and has scattered blooms through the winter in South Florida.

Softhair Coneflower is annual or biennial, with soft, almost velvety hairs on plants that reach 3 feet or more when flowering. The 2½-inch flower heads are similar to Black-eyed Susan. They have showy ray florets, but the disk is flattened and brown or purplish. Softhair Coneflower is a robust plant that can have 30 flowers open at a time from late spring through summer. It naturally occurs in sandhills and open hammocks, so plant it in sandy, well-drained soils, and mix it with other species where its height is a welcome addition to the landscape.

These plants are excellent nectar sources and are also larval hosts to some moths.

Cut flowers can last up to 10 days in bouquets.

Black-eyed Susan roots also have been used in various medicines.

The State Wildflower license plate supports Florida native wildflower planting, education and research. Get the plate and help fill our state with wildflowers!
Cutleaf Coneflower is a large perennial reaching 4 to 6 feet tall and up to 4 feet across when in full bloom in late summer and fall. Found in moist, open hammocks and floodplains of North Florida, it prefers moist settings and may need a little more shade or protection from the west sun when used in Central Florida. The lower leaves are toothed and deeply dissected. The large flowers stand 2 to 4 feet above the last leaves and have long yellow ray florets spreading from the mounding disk with greenish yellow florets. Cutleaf Coneflower’s very beautiful rosette of large, rich green leaves can be seen through much of the year, making a fine mass planting.

**Planting**

Use Black-eyed Susans in mixed wildflower beds. This and most other *Rudbeckia* species easily self-seed if open or lightly mulched areas are available.

Space Black-eyed Susans and Softhair Coneflower 14 to 18 inches apart. Space Cutleaf Coneflower about 3 feet apart.

**Seeds**

Seeds can be collected after the ray and disk flowers finish blooming. Pick a head and tear it apart to find the mature cone-shaped seeds, which should have a solid white centers. Seeds can be purchased commercially.

**Care**

Monitor plants during extra-long dry periods, especially in spring, and water deeply only as needed. Black-eyed Susan flowers can be cut after they bloom to encourage more flowering stems and lengthen the bloom period.

**Site Conditions**

This plant does well in many soil types as long as the site is well-drained and not extremely dry. Give *Rudbeckia* full sun or partial shade for the best blooming.
